

Executive Summary

PowerCo Churn Analysis

What the analysis tells PowerCo

The priority is targeted retention—not blanket discounting.

Churn affects roughly 1 in 10 customers

9.7%

9.7% of 14,606 customers are recorded as churners, making early identification a meaningful retention opportunity.

Price sensitivity is not the primary driver

Low link

Price variables show weak relationships with churn; blanket discounts should therefore not be the default retention response.

Customer economics dominate model importance

Top drivers

The Random Forest is led by 12-month consumption, net margin, meter-rent and electricity-margin measures.

Model needs refinement before deployment

5.5% recall

Accuracy is 90.3%, but recall is 5.5% and ROC-AUC is 0.665. Address class imbalance, tune the threshold and validate with a business-focused metric.
